

Exploratory Testing Report

Project Information

Project Name: Manual Testing of ChatGPT Web Application

Application Under Test (AUT): ChatGPT Web Application

Testing Type: Exploratory Testing

Tested By: Humayra Siddika Maharun

Date: July 1, 2026

Test Charter

Explore the ChatGPT web application to evaluate the usability, reliability and overall behavior of the chat interface. The objective is to identify unexpected functional issues, usability problems and UI inconsistencies related to prompt submission, AI response generation, conversation management, response controls and application behavior under different user interactions.

Test Objectives

The exploratory testing session aimed to:

- Explore the overall user workflow.
- Verify prompt submission and AI response generation.
- Examine conversation history behavior.
- Test response control features.
- Evaluate UI responsiveness and usability.
- Identify unexpected defects that may not be covered by predefined test cases.

Test Environment

- **Application:** [ChatGPT Web Application](#)
- **Browser:** Google Chrome (Latest Version)
- **Operating System:** Windows 11
- **Device:** Laptop
- **Internet Connection:** Broadband (with Slow 3G simulation for performance observation)

Testing Techniques Used

- Random Input Testing and Boundary Exploration
- Negative Testing and Error Guessing
- Workflow and UI Exploration
- Scenario-Based Testing

Areas Explored

During the session, the following areas were explored:

- Authentication
- Prompt Box
- AI Response Generation
- Conversation Management
- Conversation History
- Response Controls
- Settings and Theme
- User Interface
- Responsive Layout
- Loading Indicator
- Performance under Slow Internet

Observations

Positive Observations

- Login and logout worked as expected.
- AI generated responses successfully for different prompt types.
- Conversation history was saved automatically.
- Theme switching worked correctly.
- Copy response functionality operated as expected.
- The application remained stable during normal usage.

Areas for Improvement

- Email verification page should open only for valid email address.
- Very long prompts convert into a DOC file and required additional response time.
- UI should show prompt box in every layout screen.

Risks Identified

- AI responses may vary for the same prompt.
- Slow network conditions can affect response time.
- Future application updates may change functionality and UI behavior.

Conclusion

The exploratory testing session covered the major functionalities of the ChatGPT web application. Most features worked as expected, while a few minor usability and performance issues were identified and documented as defects. Overall, the application performed well and is suitable for normal use.
